TEIKYO UNIVERSITY ELEMENTARY SCHOOL

The school building was realized through placing an importance on contact with nature and human beings and creating a space where students can learn without inhibition. It is consistent with Teikyo University's educational goals of eliciting the individual interest of students and having them seek "their own way."

The goal of creating an eco-friendly building was achieved through the large roof that provides a link to the natural environment, and the long eaves that create light and shadow, and allow for the flow of air and water.

A media center spanning three consecutive stories is provided in the center of the school house, and is designed to be the "core center for learning."

Given that it is freely accessible from any floor, multi-dimensional studies, discussions, and presentations will take place. The construction itself creates a sense of continuation and unity of learning.
