Renewal project of an office building in Nishi-Shimbashi.
We aimed to create a building that would appeal to the city by thinking about the potential of slender buildings, a building type that occupies most of Tokyo.

The three-dimensional facade with emergency stairs has multiple functions such as structure, environment, and safety, and creates a well-formed and easy-to-use workplace inside.
Interior space becomes wider and brighter by using flat beams to ensure the ceiling height and developing a new lighting equipment with upper-and-lower light distribution.
In addition, the stairs act as a buffer with the outside world, exposing people's activities to the city.

ARAKAWA BLDG., which uses up all the building components, shows the new potential of slender buildings to contribute to a cityscape.
